## 5 Notes

### 5.1 Geometry

#### 5.1.1 Triangles

Circumradius: $R = \frac{abc}{4A}$, Inradius: $r = \frac{A}{s}$

The area of a triangle using two sides and the included angle can be given as:

$$A = \frac{1}{2}ab\sin\angle C$$

Length of median (divides triangle into two equal-area triangles): $m_a = \frac{1}{2}\sqrt{2b^2+2c^2-a^2}$

Length of bisector (divides angles in two): $s_a = \sqrt{bc\left[1-\left(\frac{a}{b+c}\right)^2\right]}$

Law of tangents: $\frac{a+b}{a-b} = \frac{\tan\frac{\alpha+\beta}{2}}{\tan\frac{\alpha-\beta}{2}}$

#### 5.1.2 Quadrilaterals

With side lengths $a,b,c,d$, diagonals $e,f$, diagonals angle $\theta$, area $A$ and magic flux $F = b^2+d^2-a^2-c^2$:

$$4A = 2ef\cdot\sin\theta = F\tan\theta = \sqrt{4e^2f^2-F^2}$$

For cyclic quadrilaterals the sum of opposite angles is $180°$, $ef = ac+bd$, and $A = \sqrt{(p-a)(p-b)(p-c)(p-d)}$.

#### 5.1.3 Spherical coordinates

$$x = r\sin\theta\cos\phi \qquad r = \sqrt{x^2+y^2+z^2}$$
$$y = r\sin\theta\sin\phi \qquad \theta = \operatorname{acos}(z/\sqrt{x^2+y^2+z^2})$$
$$z = r\cos\theta \qquad \phi = \operatorname{atan2}(y,x)$$

#### 5.1.4 Pick's Theorem:

Given a lattice polygon with non-zero area, we define: S as the area of the polygon, I as the number of integer-coordinate points strictly inside the polygon, B as the number of integer-coordinate points on the boundary of the polygon. Then, Pick's Theorem states:

$$S = I + \frac{B}{2} - 1$$

The number of lattice points on segments (x1, y1) to (x2 , y2) is: gcd(abs(x2 - x1) , abs(y2 - y1)) + 1

#### 5.1.5 Polygon

For a regular polygon with $n$ sides and side length $a$, the circumradius $R$ is given by:

$$R = \frac{a}{2\sin\left(\frac{\pi}{n}\right)}$$

#### 5.1.6 Area of a Circular Segment

The area of a circular segment, which is the region enclosed by a chord and the corresponding arc, can be calculated using the formula:

$$A = \frac{R^2}{2}(\theta - \sin\theta)$$

where: $R$ is the radius of the circle, $\theta$ is the central angle subtended by the chord, in radians.

- If $f(n,k) = C(n,0)+C(n,1)+...+C(n,k)$, Then $f(n+1,k) = 2*f(n,k)-C(n,k)$ [For multiple $f(n,k)$ queries, use Mo's algo]

**Lucas Theorem**

$$\binom{m}{n} \equiv \prod_{i=0}^{k}\binom{m_i}{n_i} (\mod p)$$

- The number of entries in the $n$th row of Pascal's triangle that are not divisible by $p = \prod_{i=0}^{k}(n_i+1)$

### 5.7.1 Primes

$p = 962592769$ is such that $2^{21} \mid p-1$, which may be useful. For hashing use 970592641 (31-bit number), 31443539979727 (45-bit), 3006703054056749 (52-bit). There are 78498 primes less than 1 000 000.

Primitive roots exist modulo any prime power $p^a$, except for $p = 2, a > 2$, and there are $\phi(\phi(p^a))$ many. For $p = 2, a > 2$, the group $\mathbb{Z}_{2^a}^{\times}$ is instead isomorphic to $\mathbb{Z}_2 \times \mathbb{Z}_{2^{a-2}}$.

### 5.7.2 Estimates

$\sum_{d|n} d = O(n\log\log n)$.

The number of divisors of $n$ is at most around 100 for $n < 5e4$, 500 for $n < 1e7$, 2000 for $n < 1e10$, 200 000 for $n < 1e19$.

### 5.7.3 Perfect numbers

$n > 1$ is called perfect if it equals sum of its proper divisors and 1. Even $n$ is perfect iff $n = 2^{p-1}(2^p-1)$ and $2^p-1$ is prime (Mersenne's). No odd perfect numbers are yet found.

### 5.7.4 Carmichael numbers

A positive composite $n$ is a Carmichael number ($a^{n-1} \equiv 1 \pmod n$ for all $a$: $\gcd(a,n) = 1$), iff $n$ is square-free, and for all prime divisors $p$ of $n$, $p-1$ divides $n-1$.

### 5.7.5 Totient

- If $p$ is a prime $(p^k) = p^k-p^{k-1}$
- If $a$ $b$ are relatively prime, $\phi(ab) = \phi(a)\phi(b)$
- $\phi(n) = n(1-\frac{1}{p_1})(1-\frac{1}{p_2})(1-\frac{1}{p_3})...(1-\frac{1}{p_k})$
- Sum of coprime to $n = n*\frac{\phi(n)}{2}$
- If $n = 2^k, \phi(n) = 2^{k-1} = \frac{n}{2}$
- For $a$ $b$, $\phi(ab) = \phi(a)\phi(b)\frac{d}{\phi(d)}$
- $\phi(ip) = p\phi(i)$ whenever $p$ is a prime and it divides $i$
- The number of $a(1<=a<=N)$ such that $gcd(a,N) = d$ is $\phi(\frac{n}{d})$
- If $n > 2$ , $\phi(n)$ is always even
- Sum of gcd, $\sum_{i=1}^{n}gcd(i,n) = \sum_{d|n}d\phi(\frac{n}{d})$
- Sum of lcm, $\sum_{i=1}nlcm(i,n) = \frac{n}{2}(\sum_{d|n}(d\phi(d))+1)$
- $\phi(1) = 1$ and $\phi(2) = 1$ which two are only odd $\phi$
- $\phi(3) = 2$ and $\phi(4) = 2$ and $\phi(6) = 2$ which three are only prime $\phi$
- Find minimum n such that $\frac{\phi(n)}{n}$ is maximum- Multiple of small primes- $2*3*5*7*11*13*...$

#### 5.7.6 Mobius function

$\mu(1)=1$. $\mu(n)=0$, if $n$ is not squarefree. $\mu(n)=(-1)^s$, if $n$ is the product of $s$ distinct primes. Let $f$, $F$ be functions on positive integers. If for all $n \in N$, $F(n)=\sum_{d|n} f(d)$, then $f(n)=\sum_{d|n}\mu(d)F(\frac{n}{d})$, and vice versa. $\phi(n)=\sum_{d|n}\mu(d)\frac{n}{d}$. $\sum_{d|n}\mu(d)=1$.

If $f$ is multiplicative, then $\sum_{d|n}\mu(d)f(d) = \prod_{p|n}(1-f(p))$, $\sum_{d|n}\mu(d)^2 f(d)=\prod_{p|n}(1+f(p))$.

$$\sum_{i=1}^{n}\sum_{j=1}^{n}[gcd(i,j)=1]=\sum_{k=1}^{n}\mu(k)\lfloor\frac{n}{k}\rfloor^2$$

$$\sum_{i=1}^{n}\sum_{j=1}^{n}gcd(i,j)=\sum_{k=1}^{n}k\sum_{l=1}^{\lfloor\frac{n}{k}\rfloor}\mu(l)\lfloor\frac{n}{kl}\rfloor^2$$

$$\sum_{i=1}^{n}\sum_{j=1}^{n}gcd(i,j)=\sum_{k=1}^{n}(\frac{\lfloor\frac{n}{k}\rfloor(1+\lfloor\frac{n}{k}\rfloor)}{2})^2\sum_{d|k}\mu(d)kd$$

#### 5.7.7 Legendre symbol

If $p$ is an odd prime, $a \in \mathbb{Z}$, then $\left(\frac{a}{p}\right)$ equals 0, if $p|a$; 1 if $a$ is a quadratic residue modulo $p$; and $-1$ otherwise. Euler's criterion: $\left(\frac{a}{p}\right)=a^{\left(\frac{p-1}{2}\right)} \pmod p$.

#### 5.7.8 Jacobi symbol

If $n=p_1^{a_1}\cdots p_k^{a_k}$ is odd, then $\left(\frac{a}{n}\right)=\prod_{i=1}^{k}\left(\frac{a}{p_i}\right)^{k_i}$.

#### 5.7.9 Primitive roots

If the order of $g$ modulo $m$ (min $n>0$: $g^n \equiv 1 \pmod m$) is $\phi(m)$, then $g$ is called a primitive root. If $Z_m$ has a primitive root, then it has $\phi(\phi(m))$ distinct primitive roots. $Z_m$ has a primitive root iff $m$ is one of 2, 4, $p^k$, $2p^k$, where $p$ is an odd prime. If $Z_m$ has a primitive root $g$, then for all $a$ coprime to $m$, there exists unique integer $i=\text{ind}_g(a)$ modulo $\phi(m)$, such that $g^i \equiv a \pmod m$. $\text{ind}_g(a)$ has logarithm-like properties: $\text{ind}(1)=0$, $\text{ind}(ab)=\text{ind}(a)+\text{ind}(b)$.

If $p$ is prime and $a$ is not divisible by $p$, then congruence $x^n \equiv a \pmod p$ has $\gcd(n,p-1)$ solutions if $a^{(p-1)/\gcd(n,p-1)} \equiv 1 \pmod p$, and no solutions otherwise. (Proof sketch: let $g$ be a primitive root, and $g^i \equiv a \pmod p$, $g^u \equiv x \pmod p$. $x^n \equiv a \pmod p$ iff $g^{nu} \equiv g^i \pmod p$ iff $nu \equiv i \pmod p$.)

#### 5.7.10 Discrete logarithm problem

Find $x$ from $a^x \equiv b \pmod m$. Can be solved in $O(\sqrt{m})$ time and space with a meet-in-the-middle trick. Let $n=\lceil\sqrt{m}\rceil$, and $x=ny-z$. Equation becomes $a^{ny} \equiv ba^z \pmod m$. Precompute all values that the RHS can take for $z=0,1,\ldots,n-1$, and brute force $y$ on the LHS, each time checking whether there's a corresponding value for RHS.

#### 5.7.11 Pythagorean triples

Integer solutions of $x^2+y^2=z^2$ All relatively prime triples are given by: $x=2mn, y=m^2-n^2, z=m^2+n^2$ where $m>n, \gcd(m,n)=1$ and $m \not\equiv n \pmod 2$. All other triples are multiples of these. Equation $x^2+y^2=2z^2$ is equivalent to $(\frac{x+y}{2})^2+(\frac{x-y}{2})^2=z^2$.

#### 5.7.12 Postage stamps/McNuggets problem

Let $a$, $b$ be relatively-prime integers. There are exactly $\frac{1}{2}(a-1)(b-1)$ numbers *not* of form $ax+by$ $(x,y\geq 0)$, and the largest is $(a-1)(b-1)-1=ab-a-b$.

#### 5.7.13 Fermat's two-squares theorem

Odd prime $p$ can be represented as a sum of two squares iff $p \equiv 1 \pmod 4$. A product of two sums of two squares is a sum of two squares. Thus, $n$ is a sum of two squares iff every prime of form $p=4k+3$ occurs an even number of times in $n$'s factorization.

The solution to the ballot problem is $\frac{a-kb}{a+b} \times C(a+b,a)$

### 5.13 Classical Problem

$F(n,k)$ = number of ways to color n objects using exactly $k$ colors

Let $G(n,k)$ be the number of ways to color n objects using no more than $k$ colors.

Then, $F(n,k) = G(n,k) - C(k,1)*G(n,k-1) + C(k,2)*G(n,k-2) - C(k,3)*G(n,k-3)$...

**Determining G(n, k)** :

Suppose, we are given a 1 * n grid. Any two adjacent cells can not have same color. Then, $G(n,k) = k*((k-1)^(n-1))$

If no such condition on adjacent cells. Then, $G(n,k) = k^n$

For positive reals $a_1, a_2, \ldots, a_n$ and $b_1, b_2, \ldots, b_n$,

$$\frac{{a_1}^2}{b_1} + \frac{{a_2}^2}{b_2} + \ldots + \frac{{a_n}^2}{b_n} \geq \frac{{a_1 + a_2 + \ldots + a_n}^2}{b_1 + b_2 + \ldots + b_n}$$

Equality holds if and only if $a_i = kb_i$ for a non-zero real constant $k$.

#### 5.16.2 Sums of games

- *Player chooses a game and makes a move in it* Grundy number of a position is xor of grundy numbers of positions in summed games.
- *Player chooses a non-empty subset of games (possibly, all) and makes moves in all of them* A position is losing iff each game is in a losing position.
- *Player chooses a proper subset of games (not empty and not all), and makes moves in all chosen ones.* A position is losing iff grundy numbers of all games are equal.
- *Player must move in all games, and loses if can't move in some game* A position is losing if any of the games is in a losing position.
